Summary

Backend Software Engineer with 2 years of hands-on software development experience across internship and full-time roles, including 1 year of full-time experience, designing and shipping REST APIs and microservices with FastAPI, NestJS, and Django REST Framework. Experienced in relational database design and query optimization (PostgreSQL, MySQL), authentication (JWT, RBAC), CI/CD pipelines (Jenkins, Docker), and third-party API integration (Gemini, Claude, Ollama, Razorpay). Additional full-stack delivery experience with React and Angular.

Skills

- **Programming Languages:** Python, TypeScript, JavaScript, Java, SQL
- **Backend Technologies:** FastAPI, NestJS, Django REST Framework, REST APIs
- **Databases & Caching:** PostgreSQL, MySQL, MongoDB, Redis
- **CI/CD & Infrastructure:** Jenkins, SonarQube, Docker, Docker Compose, Reverse Proxy, Git, MinIO (S3-compatible), Alembic
- **Messaging & Async Processing:** RabbitMQ, Celery, WebSockets
- **Authentication & Security:** JWT, Access/Refresh Tokens, RBAC, Fernet Encryption
- **Identity Verification:** Face Recognition (face embeddings), OCR
- **Payments:** Razorpay (subscription integration)
- **AI Technologies:** Gemini API, Anthropic (Claude) API, Ollama, LLM Integration
- **Frontend Technologies:** React, Angular, HTML, CSS, Tailwind CSS, Highcharts
- **Developer Tools:** Postman, Jira, Unit Testing, Agile

Experience

InfyShine

June 2026 – Present

Software Engineer

- Designed and secured production REST APIs with JWT-based access/refresh token authentication and RBAC, enforcing multi-role permission boundaries.
- Architected WebSocket-driven real-time session handling for an online examination and live-proctoring platform under concurrent load.
- Built a KYC verification module using a cmake-based face recognition library for face embedding generation and matching, combined with OCR-based document data extraction for identity verification.
- Integrated Razorpay to manage subscription-based payments, tying user role and feature access to active subscription status.
- Set up a Jenkins CI/CD pipeline with staged packaging, automated testing and code quality analysis (SonarQube), build, database migration, and deployment steps, with services containerized via Docker Compose behind a reverse proxy.
- Offloaded long-running tasks to Celery/Redis background workers, reducing request latency and improving resilience during peak usage.
- Tuned PostgreSQL schemas and query indexing at production scale, improving performance and data integrity.
- Integrated the Gemini API to auto-generate resume-based interview questions, and delivered the corresponding React frontend integration end-to-end.
- Implemented MinIO object storage and Alembic-managed schema migrations, strengthening deployment reliability.

Akrivia

Software Development Engineer Intern

July 2024 – August 2025

Software Development Engineer

August 2025 – May 2026

- Developed interactive BI dashboards in Angular with Highcharts (5+ drill-down visualizations), backed by Redis caching for sub-200ms response times.
- Implemented end-to-end form validation with Zod across field- and cross-field rules, preventing invalid and injection-based input from reaching backend services.
- Designed bulk Excel ingestion pipelines (ExcelJS) for 1,000+ row datasets, coordinated via RabbitMQ to preserve ACID consistency across microservice databases.
- Reduced redundant database load by 40% through targeted Redis caching on high-traffic endpoints.
- Defined RESTful API contracts with unit test coverage and asynchronous inter-service sync via RabbitMQ.

Projects

QueryMind – Natural Language to SQL Engine

2025

Python, FastAPI, React, NestJS, PostgreSQL, Redis, RabbitMQ, Celery, Docker

- Architected a distributed NL-to-SQL platform (NestJS gateway, FastAPI query service, React dashboard) with multi-database routing across PostgreSQL, MySQL, and SQLite.
- Engineered an asynchronous SQL generation pipeline using a local LLM (Ollama), validated through regex filtering, SQLGlot AST parsing, and schema verification.
- Hardened the platform with Fernet-encrypted credentials, SQL-injection prevention, SELECT-only enforcement, and JWT-based RBAC for multi-tenant security.
- Optimized performance with Redis schema caching (sub-200ms) and asyncpg connection pooling, cutting introspection overhead by 60%.
- Designed and implemented the React dashboard for query submission, result visualization, and multi-database connection management.

ResumeJobMatcher – AI-Powered Resume-to-Job Matching Platform

Angular 17, TypeScript, Tailwind CSS, Anthropic Claude API

- Built a client-side resume-to-job matching application in Angular 17 (standalone components, signals) styled with Tailwind CSS.
- Implemented in-browser resume parsing for PDF and DOCX formats using pdfjs-dist and mammoth, extracting resume text without a backend service.
- Integrated the Anthropic Claude API to analyze parsed resume content and return ranked, matched job listings with direct apply links.
- Designed a security-conscious client-only architecture: API keys held in `sessionStorage` only, resume text never persisted, and all requests sent directly from the browser to the Claude API.

Blogs Management – Full Stack Blog Platform

TypeScript, Angular, HTML, CSS

- Built a full-stack blog management application with a dedicated TypeScript backend service and an Angular-based frontend interface.
- Implemented CRUD REST APIs for blog content, enabling creation, retrieval, updating, and deletion of posts.
- Designed a component-based Angular UI for authoring and managing blog content, connecting directly to the backend API layer.

Achievements

- B.Tech Honours Degree in Computer Science and Engineering
- DBMS – NPTEL Certification, September 2024

Education

Bachelor of Technology (Honours), Computer Science and Engineering (IoT)

GPA: 8.85/10
